```
{
    printf("Total Amount = %f", x);
}
```

(6) open Amazon website and findout ten different functions.

(1) return 0 and return 1 means what? and main returns to whom?

① 10 different functions

① search bar
② payment
③ Deals
④ whistlist
⑤ cart
⑥ product filtering
⑦ ~~location~~ voice search
⑧ seller information
⑨ sign in
⑩ order history

② return 0 :

* return 0 means program executed successfully.
* 0 is the standard success exit code.
* The OS recieves this value and understands that the program finished without errors.

return 1 :

* return 1; means the program ended with an error or unsuccessful execution.
* 1 is a common error code, but programmers can use other non-zero values (2, 3, 4 etc.) to represent different types of errors.

To whom does main() return?

* main() returns to the operating system (OS).
* The OS uses this value to determine whether the program ended successfully (0) or with an error (non-zero).
